Abstracts

Laminated aluminium foil is a composite material consisting of a thin layer of aluminium foil bonded to one or more layers of other materials, such as plastic films, paper, or non-woven fabrics, through adhesives or extrusion coating processes. This combination leverages the barrier properties of aluminium?including impermeability to moisture, oxygen, light, and microorganisms?with the structural, printing, or sealing advantages of the other layers, making it highly versatile for applications requiring durability, preservation, and aesthetic appeal. It is widely used in flexible packaging for food, pharmaceuticals, and consumer goods, as well as in insulation materials for construction and industrial uses, where its multi-functional characteristics provide enhanced protection, extended shelf life, and improved product integrity.

The global Laminated Aluminium Foil market size was estimated at USD 4250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
