Abstracts

A laminated metal compound refers to a composite material formed by bonding two or more layers of different metals or metal alloys through processes such as rolling, explosion welding, or diffusion bonding, creating a synergistic structure that leverages the distinct properties of each layer?such as corrosion resistance, electrical conductivity, thermal conductivity, strength, or magnetic properties?in a single integrated unit. These materials are engineered to address specific performance requirements that monolithic metals cannot achieve alone, offering tailored solutions for industries where multifunctionality, durability, and cost-efficiency are critical. Common examples include cladding precious metals like silver or gold onto base metals for electrical contacts, combining stainless steel with carbon steel for corrosion-resistant structural applications, or layering metals with contrasting thermal expansion coefficients for precision components in electronics and aerospace. The lamination process must ensure strong interfacial bonds to prevent delamination under operational stresses, making manufacturing techniques and quality control pivotal to the material?s reliability and performance in demanding environments.

The global Laminated Metal Compound market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
