Abstracts

Laminoplasty fixed plates are specialized orthopedic implants utilized in spinal surgery to stabilize and secure the expanded lamina following a laminoplasty procedure, which is performed to decompress the spinal canal in cases of cervical myelopathy or stenosis. These plates are typically made from biocompatible materials such as titanium or titanium alloys, and they are designed with screw fixation systems to maintain the surgically created space, prevent re-closure of the lamina, and promote bone healing while allowing for early mobilization. The device functions by bridging the gap between the cut edges of the lamina, providing immediate mechanical stability, reducing the risk of postoperative complications, and contributing to improved long-term neurological outcomes by preserving spinal alignment and motion.

The global Laminoplasty Fixed Plate market size was estimated at USD 65.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
