Abstracts

A LAN (Local Area Network) Network Transformer is a critical component in Ethernet networks, primarily designed to isolate and protect network devices from electrical noise, surges, and other disturbances. It acts as a barrier between devices, preventing the propagation of unwanted signals that can degrade network performance and cause data corruption. By employing magnetic coupling, LAN transformers efficiently transmit data signals while blocking common-mode noise. This isolation ensures reliable data transmission, especially in environments with high levels of electromagnetic interference (EMI).

The global LAN Network Transformer market size was estimated at USD 338.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
