## Abstracts

Laparoscopic cannulas, also known as trocars, are specialized medical devices used in minimally invasive surgery to create and maintain access ports through the abdominal wall, allowing surgeons to insert instruments such as cameras, graspers, and scissors while maintaining pneumoperitoneum (the inflation of the abdominal cavity with carbon dioxide gas). They typically consist of a sharp obturator for initial puncture, a hollow sleeve or port that remains in place after insertion, and often include features such as sealing mechanisms to prevent gas leakage and reduce instrument friction. Designed for single-use or reusable applications, these devices vary in size, material, and tip configuration (e.g., bladed, bladeless, or optical) to accommodate different surgical needs and enhance patient safety by minimizing tissue trauma and the risk of postoperative complications.

The global Laparoscopic Cannulas market size was estimated at USD 180.22 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
