Abstracts

The laparoscopic fascial port closure device is a medical device used to close the fascial port after laparoscopic surgery. It is designed to effectively close the abdominal incision with minimal trauma and reduce the occurrence of postoperative complications such as hernia. Laparoscopic surgery usually inserts instruments through several small incisions, some of which penetrate the fascia layer of the abdominal wall. These fascial incisions need to be closed after surgery to prevent leakage of abdominal contents or hernia. The device is designed to quickly and accurately close the fascial port through a small incision, and usually includes a specialized stapler or stapler that can tighten and fix the edges of the fascia layer while reducing interference with surrounding tissues.

The global Laparoscopic Fascial Port Closure Device market size was estimated at USD 329.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
