Report Overview

Large Sample AFM (Atomic Force Microscopy) is a specialized variant of AFM technology designed to analyze samples that are significantly larger than those typically handled by conventional AFMs, which are often limited to small, flat surfaces. This instrumentation enables high-resolution imaging, measurement, and manipulation of materials at the nanoscale across extensive sample areas, making it particularly valuable in industries such as semiconductors, materials science, and life sciences, where examining larger surfaces without compromising resolution is critical. Large Sample AFMs incorporate advanced positioning systems, extended scan ranges, and adaptive optics to accommodate diverse sample geometries, ensuring precise topographical and mechanical property mapping. Their applications span from quality control in manufacturing to advanced research in nanotechnology, where understanding surface characteristics over broader regions is essential for innovation and process optimization. The growing demand for miniaturization and precision in high-tech industries has driven advancements in Large Sample AFM systems, positioning them as a crucial tool for both industrial and academic research.
