Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Large Electrodeionization (EDI) Systems competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Large EDI System production reached approximately 7,680 units, with an average global market price of around US\$ 185,000 per unit. The gross profit margin of major manufacturers ranges from 32% to 48%. Single-line production capacity usually falls between 180 and 420 units each year, depending on membrane-stack production capability and system-integration complexity. Large EDI systems are advanced water-purification units that remove ions using ion-exchange membranes, resins, and electric fields without the chemical regeneration required by traditional deionizers. They offer continuous ultra-pure water production, long-term operational stability, and low environmental impact. These systems are widely used in power plants, electronics manufacturing, pharmaceuticals, and large industrial water-treatment facilities. The industrial chain includes upstream suppliers of ion-exchange membranes, resins, power modules, flow components, and stainless-steel housings. Midstream manufacturers assemble membrane stacks, integrate pumps and controls, conduct pressure testing, and finalize system installation. Downstream users include semiconductor fabs, pharmaceutical plants, electric-power utilities, food-processing facilities, and industrial ultrapure-water systems. The market for large EDI systems is expanding rapidly as industries increasingly require high-purity water for production, cooling, and chemical processes. Semiconductor fabrication and pharmaceutical manufacturing remain the strongest demand drivers due to stringent water-quality standards. Power plants and industrial facilities are replacing traditional mixed-bed deionizers with EDI to eliminate chemical regeneration and reduce environmental impact. Advances in membrane materials, stack durability, and high-efficiency power

modules are improving system reliability and lowering lifecycle costs. The global shift toward green manufacturing and water-recycling technologies further accelerates adoption. With growing investments in electronics, biopharmaceuticals, and clean-energy infrastructure, the demand for large EDI systems will continue to grow steadily over the next decade.

The global Large Electrodeionization (EDI) Systems market size was estimated at USD 1420.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
