## Abstracts

Large Outer Diameter Bearing Cage is a crucial component used in large-sized bearings. During the operation of the bearing, the rolling elements (such as balls and rollers) need to maintain appropriate spacing and stable motion trajectories, and the large outer diameter bearing cage undertakes this important responsibility. It is usually made of materials with high strength, wear resistance, and low friction coefficients, such as special engineering plastics and high-quality steel. Since the outer diameter of the bearing it is applied to is relatively large, the size specification of the cage is also correspondingly large, and it needs to have good structural strength and precision to adapt to working conditions with large loads and high rotational speeds. The large outer diameter bearing cage can prevent mutual collision and friction between the rolling elements, reduce wear and noise, and at the same time ensure that the rolling elements are evenly distributed in the circumferential direction, making the bearing operation more stable and reliable. It is widely used in large mechanical equipment, wind turbines, ships and other fields with high requirements for bearing performance.

The global Large Outer Diameter Bearing Cage market size was estimated at USD 712.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
