## Abstracts

A chiller system with a large temperature difference refers to a system that reduces the flow rate of chilled water or cooling water, thereby increasing the temperature difference of chilled water or cooling water, which reduces the energy consumption of water pumps and cooling towers, thereby achieving the purpose of saving system operating energy consumption. Compared with traditional chillers, a chiller with a large temperature difference can deliver more cooling capacity at the same flow rate, reduces the energy consumption of water pumps, and significantly improves the overall energy efficiency of the system. The core advantage of this unit lies in its efficient heat exchange technology and optimized refrigeration cycle design. It uses advanced evaporator and condenser materials to enhance heat transfer efficiency and reduce the use of refrigerant.

The global Large Temperature Difference Chiller Units market size was estimated at USD 2456.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
