Abstracts

The laser articulated arm measuring machine consists of an articulated arm equipped with a laser scanner. The laser scanner emits a laser beam and scans the target surface, and the reflection of the laser beam is received by the measuring sensor. Based on the reflection time and intensity of the laser beam, the system can quickly calculate the three-dimensional coordinates of each point on the target surface. By continuous scanning, detailed point cloud data of the object surface can be obtained, which can then be used for 3D modeling, shape analysis, and size measurement.

The global Laser Articulated Arm Measuring Machine market size was estimated at USD 68.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
