## Abstracts

Laser scanning confocal microscopes are a type of microscope that uses a laser beam to scan the sample and obtain high-resolution images through confocal technology. The microscope uses a laser as the light source and scans the sample point by point or line by line to collect clear fluorescent signals. A small aperture is used to isolate light signals from the focal plane while blocking scattered light from other areas, eliminating background noise and depth blur, resulting in sharp and detailed images. Laser scanning confocal microscopes are capable of capturing three-dimensional images and are widely used in biology, medicine, materials science, and other fields, particularly for observing cells, tissue structures, and nanomaterials.

The global Laser Confocal Microscopes market size was estimated at USD 158.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.20% during the forecast period.
