Abstracts

Laser cutting materials encompass a diverse range of substances specifically engineered or selected for their compatibility with laser cutting processes, defined by their ability to absorb laser energy efficiently, vaporize or melt cleanly along the cut path, and produce minimal hazardous byproducts. These materials are categorized primarily by composition?including metals (such as stainless steel, aluminum, and brass), non-metallics (like acrylic, wood, leather, and textiles), plastics (e.g., polycarbonate, ABS, and PETG), and specialized composites?each with distinct properties such as thickness, reflectivity, thermal conductivity, and chemical stability that determine their suitability for specific laser types (CO?, fiber, or diode lasers) and applications across industries like manufacturing, signage, automotive, aerospace, and consumer goods. The selection of a material is critical not only for cut quality and precision but also for operational safety and compliance with environmental regulations, as some materials may release toxic fumes or require specific ventilation systems during processing.
