## Abstracts

Laser debonding is to quickly irradiate laser energy on the adhesive material to partially dissociate the adhesive material, thereby separating the temporary substrate from the wafer. Using the laser debonding process, a layer of laser release layer (Laser Release Layer) is first coated or bonded on a temporary substrate, and the subsequent processes are all carried out on this substrate. After the packaging process is completed, the laser is applied to the adhesive material to separate the wafer from the temporary substrate. In this process, the laser will pass through the transparent glass sheet and reach the surface of the adhesive material, and evenly apply the laser energy to the adhesive material in a scanning manner, quickly separating the adhesive material and the glass. In recent years, with the rapid development of the semiconductor industry and electronic technology, laser debonding technology has gradually become an efficient and precise choice, and its market demand has also been growing steadily.

The global Laser Debonding Equipment market size was estimated at USD 182.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
