Report Overview:

Principally, Laser Doppler Flowmetry (LDF) makes use of the fact that when a coherent, low-powered laser illuminates tissue, light is scattered in static structures as well as in moving blood cells within the microcirculatory beds. Photons, scattered by the moving blood cells, are spectrally broadened according to the Doppler effect.

LDF is established as an effective and reliable method for the measurement of blood perfusion in the microvasculature because LDF provides continuous, noninvasive and real-time measurement capabilities.

The Global Laser Doppler Flowmeter Market Size was estimated at USD 366.26 million in 2023 and is projected to reach USD 610.88 million by 2029, exhibiting a CAGR of 8.90% during the forecast period.
