Report Overview

Laser hardening—also referred to as laser case hardening—is a heat treating process used to improve the strength and durability of component surfaces. It employs the use of high-powered diode lasers that apply energy to heat localized areas of the component surface. As the lasers move across the surface it instantaneously heats the surface and a desired case above the austenizing temperature as the laser passed over this volume of metal it self-quenches (i.e., cools) rapidly through conduction, resulting in the formation of a martensitic structure and, consequently, the hardening of the material.
