### Report Overview

Laser induced breakdown spectrometer is a new analytical method in the field of spectral analysis. Its basic principle is to use a high-energy laser light source to form a high-intensity laser spot (plasma) on the surface of the analytical material, so that the sample can be excited to emit light. These light is then analyzed through the spectral system and detection system. This technique is very sensitive to most inorganic elements in the material. It can also analyze elements with low atomic numbers.
