Abstracts

Laser interference film thickness measuring instrument is an instrument used to measure the thickness of thin films. It is based on the principle of laser interference and accurately measures the thickness of the thin film by analyzing the reflection and interference phenomena of the thin film towards the laser. Laser interference film thickness measuring instruments usually have the following characteristics and functions: laser interference principle: the measuring instrument uses a laser beam to irradiate the film and detect the reflected and interference light of the laser. The thickness of the thin film can cause a phase difference between reflected light and interference light. By measuring the phase difference, the thickness of the thin film can be determined. High precision measurement: The laser interference film thickness measuring instrument has high-precision measurement capabilities, which can measure film thickness at the nanoscale or even subnanometer level. Rapid measurement: Measuring instruments typically have the ability to quickly measure thin film thickness in a short period of time. Multi wavelength measurement: Some laser interference film thickness measuring instruments have the function of multi wavelength measurement, which can be measured at different wavelengths to adapt to different film materials and application requirements. Automation control: Measuring instruments are usually equipped with an automation control system that can automatically adjust the position and angle of the laser beam to ensure measurement accuracy and repeatability. Data analysis and display: Measuring instruments usually have data analysis and display functions, which can present measurement results in image or digital form, making it convenient for users to analyze and process data. Laser interferometric film thickness measuring instruments are widely used in fields such as thin film processing, optical coatings, semiconductor manufacturing, and material research. It can be used to measure the thickness of various types of thin films, such as optical films, metal films,

coating films, biofilms, etc., providing important data support for material characterization and quality control.

The global Laser Interferometric Film Thickness Measuring Instrument market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
