Report Overview:

Laser mirrors and other types of mirrors are generally fabricated by depositing some kind of mirror coating – a dielectric coating or sometimes a metal coating – on a suitable uncoated mirror substrate. In most cases, such a substrate is made of some glass (or sometimes of glass ceramics, rarely of a metal) and has a cylindrical shape. Such a piece with e.g. 25 mm diameter fits into a standard mirror holder, with which the mirror (which may be part of a laser resonator, for example) can be accurately and stably positioned. Rectangular shapes are also available. The front surface and sometimes also the back surface needs to be polished with a high optical quality.

The Global Laser Mirror Substrate Market Size was estimated at USD 248.50 million in 2023 and is projected to reach USD 348.53 million by 2029, exhibiting a CAGR of 5.80% during the forecast period.
