Report Overview:

A noise eater is a device made for reducing the intensity noise in a laser beam. The principle of operation is that the optical power is reduced with an electrically controllable attenuator, and the control signal is derived from the input power (feedforward scheme) or the output power (feedback scheme) as measured with, e.g., a fast photodiode. Essentially, the attenuation is increased when the power is measured to be too high, and vice versa. This makes it possible to stabilize the laser power, i.e., to decrease intensity noise.

The Global Laser Noise Eater Market Size was estimated at USD 133.25 million in 2023 and is projected to reach USD 186.89 million by 2029, exhibiting a CAGR of 5.80% during the forecast period.
