Abstracts

A laser printer photosensitive drum is the consumable component of a laser printer. The process works by charging up the surface of a cylinder (the drum) to a high voltage. The drum then rotates so that any parts of it that are charged pick up black particles, called the toner. Then a piece of paper is pressed against the drum as it rotates further. That causes the black stuff to stick to the paper.

The global Laser Printer Photosensitive Drum market size was estimated at USD 5017.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
