## Abstracts

Laser processing control card, referred to as control board, is a circuit board assembly with built-in chips and various electronic components. It is not only the carrier of the program, but also supports seamless connection with the computer through various communication protocols such as PCI, USB, PCIE, TCP/IP, etc. In practical applications, laser processing control cards often work in conjunction with CAD software. The user first uses CAD software on the computer to design the processing requirements, and generates key instruction parameters such as the trajectory and rate of laser processing based on this. Subsequently, these parameters are converted into signals and sent to the control card in the device, which executes them accurately and drives the processing equipment to complete the predetermined operations.

The global Laser Processing Control Boards market size was estimated at USD 271.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
