## Report Overview:

Laser pumping is the act of energy transfer from an external source into the gain medium of a laser. The energy is absorbed in the medium, producing excited states in its atoms. When the number of particles in one excited state exceeds the number of particles in the ground state or a less-excited state, population inversion is achieved. In this condition, the mechanism of stimulated emission can take place and the medium can act as a laser or an optical amplifier. The pump power must be higher than the lasing threshold of the laser. Capable of operating at high repetition rates, these flash lamps generate light over a continuous spectrum from ultraviolet to infrared.

The Global Laser Pump Lamps Market Size was estimated at USD 631.35 million in 2023 and is projected to reach USD 968.93 million by 2029, exhibiting a CAGR of 7.40% during the forecast period.
