## Abstracts

Laser pumping is the process of providing energy to a laser medium (the material that amplifies light) to excite its atoms or molecules, raising them from a lower-energy state to a higher-energy state. This energy input is essential to achieve the population inversion required for laser action, where more atoms or molecules are in an excited state than in the ground state. This inversion allows for the amplification of light and the generation of coherent laser output.

The global Laser Pumping market size was estimated at USD 322.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
