Abstracts

Laser release materials are specialized substrates designed to enable the clean and precise separation of delicate components, such as semiconductor wafers, microelectronic devices, or flexible electronics, through the application of laser energy. These materials typically consist of a base carrier film coated with a light-absorbing or light-reactive layer that decomposes, ablates, or undergoes a phase change upon exposure to a specific wavelength of laser light, thereby releasing the bonded component without mechanical stress, residue, or damage. They are engineered to offer controlled adhesion strength, high thermal stability, and compatibility with various manufacturing processes, serving as critical enablers in advanced packaging, MEMS fabrication, and emerging applications like wearable sensors and foldable displays.

The global Laser Release Materials market size was estimated at USD 220.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
