Abstracts

A laser scan micrometer is a high-precision non-contact dimensional measurement instrument that utilizes laser triangulation or diffraction principles to scan and calculate the outer dimensions of small objects, such as wires, shafts, fibers, and precision-machined components, with typical accuracy in the sub-micron range. It projects a collimated laser beam onto a rotating or oscillating mirror, creating a scanning motion across the target, while a detector captures the shadow or diffracted pattern to determine size through real-time signal processing. Valued for its speed, repeatability, and ability to measure delicate or moving materials without physical contact, this device is widely applied in industries requiring stringent quality control, including automotive, aerospace, electronics, medical device manufacturing, and telecommunications.

The global Laser Scan Micrometers market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
