Report Overview

Laser hardening is a heat treatment process or case hardening process in which a laser beam is used to heat the surface of a metal part, which is then rapidly cooled in the surrounding air. This method is specifically used for ferrous materials suitable for hardening, including steel and cast iron, with a carbon content in excess of 0.2%. Laser hardening requires less cleaning and has the ability to handle irregular three-dimensional workpieces. Laser hardening increases hardness and wear resistance, which results in a reduction in abrasive wear.

The global Laser Surface Hardening Technology market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Laser Surface Hardening Technology market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
