### Report Overview

Laser color television (laser TV), or laser color video display utilizes two or more individually modulated optical (laser) rays of different colors to produce a combined spot that is scanned and projected across the image plane by a polygon-mirror system or less effectively by optoelectronic means to produce a color-television display. The systems work either by scanning the entire picture a dot at a time and modulating the laser directly at high frequency, much like the electron beams in a cathode ray tube, or by optically spreading and then modulating the laser and scanning a line at a time, the line itself being modulated in much the same way as with digital light processing (DLP). The global laser video display market is expected to witness the significant growth rate during the forecast period (2018-2023). Factors motivating the growth of this market include the increase in demand for large displays and for various digital advertising of products at shopping malls, airports and coffee shops.
