Abstracts

Laser wood cutting service is a professional service that uses a high-energy-density laser beam to accurately cut wood. Its working principle is based on the interaction between laser and wood materials. After the laser beam is focused by the optical system, it forms an extremely fine high-temperature light spot. When the light spot irradiates the wood surface, the wood absorbs the laser energy and the temperature rises sharply in a very short time, reaching the ignition point or thermal decomposition temperature of the wood, thereby inducing physical and chemical changes such as combustion, vaporization or thermal decomposition of the wood, so that the wood in the area irradiated by the light spot is quickly removed, forming a cutting seam. Laser wood cutting services have become one of the core technologies in the fields of furniture manufacturing, architectural decoration, cultural and creative crafts, etc., with their high-precision, non-contact processing and flexible design capabilities. At present, the service presents the following development characteristics: on the technical side, fiber lasers and ultrafast lasers (such as picosecond/femtosecond lasers) are popularized, and the cutting accuracy can reach within 0.1mm, and the heat-affected zone is significantly reduced, effectively avoiding the problems of scorching edges and cracking in traditional mechanical cutting, especially suitable for fine processing such as thin veneer and solid wood parquet; on the market side, the surge in customized demand has promoted the upgrading of service models. Laser cutting companies have achieved flexible production of "one-click drawing-fast cutting-batch delivery" through digital design platforms and intelligent manufacturing systems to meet short-cycle and small-batch orders such as personalized home furnishings and art installations; on the application side, the boundaries of the industry continue to expand. In addition to traditional wood products, laser cutting technology has penetrated into the processing of new materials such as carbonized wood, bamboo, and composite panels, and explored composite applications with 3D printing, CNC engraving and other processes.

The global Laser Wood Cutting Service market size was estimated at USD 1939.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
