Abstracts

Laser cleaning is a method of removing contaminants from different types of material. The main scope of application of this technology is the cleaning of metals from corrosion. Laser cleaning systems are making their way as great alternatives to traditional surface cleaning methods like chemical cleaning and abrasive blasting. Laser cleaning systems require the use of suitable lasers. Automatic cleaning procedures, typically used to prepare surfaces for further industrial operations, must follow the modifications introduced by Industry 4.0. Furthermore, chemical solvents are used, which results in potentially dangerous vapors and liquid waste products, and abrasive blasting systems cause significant waste and damage to delicate surfaces. These issues prompted the adoption of surface cleaning solutions based on laser technology. The automotive industry has significantly contributed to the laser cleaning market, one of the prime driving factors. During the car manufacturing process, automotive developers look for an easy and quick way to treat composite parts before bonding to ensure the integrity of the frame's structure.

The global Lasers for Cleaning market size was estimated at USD 185.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.00% during the forecast period.
