Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Latch Type Hall IC competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The latch type Hall IC is a magnetic field sensing device with digital output. It locks and switches the switch state through the alternating action of positive and negative magnetic fields. When a South Pole magnetic field of sufficient strength is applied, it triggers the on and maintains the state until it encounters a magnetic field of opposite polarity (North Pole). At this time, the device is turned off and locks the new state. It can maintain the output without a continuous magnetic field. It is suitable for brushless DC motor rotor position detection, window lift limit control, motion monitoring in industrial automation and other scenarios. Its core advantages lie in high anti-interference ability, wide operating temperature range and low power consumption design. It filters the weak magnetic field fluctuations caused by mechanical vibration or electromagnetic noise through hysteresis difference, ensuring stable and reliable switching signals in complex environments.

The global Latch Type Hall IC market size was estimated at USD 784.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
