Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on LCD and PCB Photoresist Resin competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. LCD and PCB photoresist resins are key film-forming polymer materials used in the manufacturing of liquid crystal displays (LCDs) and the patterning process of printed circuit boards (PCBs), respectively. LCD photoresist resins are mainly used for photolithography of color filters and array substrates, primarily composed of acrylates or polyimides, requiring high transmittance, low metal ion content, and excellent thermal stability. PCB photoresist resins are mostly alkali-soluble phenolic resins or modified epoxy/acrylic resins, used in dry film or liquid photoresists, requiring good adhesion, etching resistance, and development resolution. The upstream of the industry chain consists of suppliers of electronic-grade monomers (such as p-hydroxystyrene and acrylates), solvents (PGMEA), and photosensitizers; the midstream is dominated by international giants such as Nitto Denko, JSR, Tokyo Ohka Kogyo, and Sumitomo Chemical in the high-end market; and the downstream connects with panel manufacturers (BOE, TCL CSOT) and PCB manufacturers (Pengding, Shennan Circuits). Driven by the localization of semiconductor production and the upgrading of the display industry, high-resolution, low-defect, and environmentally friendly photoresist resins are becoming a key focus for overcoming bottlenecks in electronic chemicals, accelerating the process of self-reliance and control of the industry chain. In 2024, the global production of LCD and PCB photoresist resins reached 49,000 tons, with an average selling price of US\$44,755 per ton, a single production line capacity of 2,000 tons, and a gross profit margin of 36%. According to our Semiconductor Research Center, the global total output value of PCB was about US\$ 81 billion in 2022. With strong drivers from new technology, such as AI, 5G and new energy vehicles, it is

estimated that the PCB industry will continue to grow steadily in the next six years. Global PCB manufacturers are mainly located in China mainland, China Taiwan, Japan, South Korea, Europe and the United States. Among them, Chinese local PCB companies hold the biggest share. Currently, the LCD and PCB photoresist resin industries exhibit a differentiated pattern: "accelerated localization of PCB resins, while LCD resins remain in a critical stage of development." Driven by policy support and downstream demand, PCB photoresist resins have achieved a high degree of self-sufficiency; however, LCD photoresist resins, due to their extremely high requirements for purity, transmittance, and batch stability, still heavily rely on Japanese and Korean manufacturers such as JSR, Tokyo Ohka Kogyo, and DIC. Future trends focus on three main directions: first, high-performance materials, developing new resin systems with high photosensitivity and low linewidth roughness (LWR); second, supply chain security, accelerating the vertical integration of monomers, resins, and photoresists to enhance domestic supporting capabilities; and third, green and low-carbon processes, promoting solvent-free synthesis and low-VOC formulations to meet ESG requirements. With the evolution of new display technologies such as OLED and Mini/Micro-LED, advanced photoresist resins that combine high resolution and environmental adaptability will become the competitive high ground.

The global LCD and PCB Photoresist Resin market size was estimated at USD 2715.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
