Report Overview

Polarizer, the full name of polarizer, is mainly made of PVA film, TAC film, protective film, release film and pressure-sensitive adhesive. It can control the polarization direction of a specific light beam. When natural light passes through a polarizer, the light whose vibration direction is perpendicular to the transmission axis of the polarizer will be absorbed, leaving only the polarized light whose vibration direction is parallel to the transmission axis of the polarizer.

There are two polarizers in the LCD module attached to both sides of the glass substrate. The lower polarizer is used to convert the light beam generated by the backlight into polarized light. The upper polarizer is used to analyze the polarized light after being electrically modulated by the liquid crystal to produce The contrast between light and dark creates a display. The imaging of the LCD module must rely on polarized light. Without any polarizer, the LCD module cannot display images.
