Report Overview:

LCD photoresists is a large class of photoresist. Their main ingredients include resins, photosensitive agents, solvents and additives, and other components, mainly Color resist, Black Matrix Resist, Overcoat Resist, Photo Spacer and others.

Color resists

Color resists, generally known as photoresist(s), are used to form color filter layers of LCD panels consisted of red, green and blue colors, they are key materials in determining color saturation and contrast for displays.

Color resists are produced by mixing pigments and polymeric binders together, with later additions of dispersants and solvents to create formulations that protect color underlayers during curing processes. The color resists predominantly provide resistance to fading, thermal and chemical degradation, but also provide secondary protection for parts created in the lattice formations that require further treatments and processing during LCD manufacturing.

Black Matrix

Black Matrix is arranged in the form of stripes, grids or mosaics between color patterns of the Red, Green and Blue pixel arrays in the color filter. This product is designed for high light-shielding properties to increase the contrast ratio of LCD panels. Additionally, black matrix is deposited to a glass substrate to prevent leakage of backlight and color mixing from adjacent pixel formations, which also enhances contrast.

The Global LCD Photoresists Market Size was estimated at USD 1275.10 million in 2023 and is projected to reach USD 1452.94 million by 2029, exhibiting a CAGR of 2.20% during the forecast period.
