Abstracts

LCoS (Liquid Crystal on Silicon) chips are a type of display technology that utilizes liquid crystal panels mounted on a silicon backing. These chips function by modulating light through liquid crystal cells arranged on a silicon substrate, which allows for the precise control of light and color. LCoS chips are commonly used in applications such as high-resolution projectors, head-up displays, and various optical devices due to their ability to deliver sharp images and high color accuracy. The technology benefits from the high pixel density of silicon, leading to finer resolution and better image quality compared to other display technologies like LCD or DLP. Additionally, LCoS chips offer advantages such as low power consumption and compact form factors, making them suitable for a wide range of advanced imaging and display applications.

The global LCoS Chips market size was estimated at USD 1356.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.20% during the forecast period.
