Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on LCoS Light Valve Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of LCoS light valve chips is 3.017 million units, with an average selling price of US\$116 per unit. LCoS light valve chips are microdisplay devices based on silicon-based reflective liquid crystal technology. They integrate a liquid crystal layer directly onto the surface of a CMOS silicon chip, modulating reflected light by controlling the arrangement of liquid crystal molecules to achieve image display or optical modulation. Unlike traditional LCDs, LCoS uses a reflective structure. Light enters from the front, is modulated by the liquid crystal layer, and then reflected back by the silicon-based reflective layer. This structure offers advantages such as high resolution, high contrast, low power consumption, and a small size. LCoS chips are widely used in projection displays, AR/VR headsets, automotive HUDs, optical communications, 3D printing, and other fields, and are one of the core components of the new generation of microdisplays and light modulation.

The global LCoS Light Valve Chip market size was estimated at USD 350.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
