Abstracts

A leachate pool geomembrane is a specialized synthetic liner composed of high-density polyethylene (HDPE), linear low-density polyethylene (LLDPE), or polyvinyl chloride (PVC) designed to serve as an impermeable barrier in containment systems for leachate—the contaminated liquid generated from water percolating through waste in landfills, mining operations, or industrial sites. Its primary function is to prevent leachate from infiltrating soil and groundwater, thereby mitigating environmental contamination risks. These geomembranes are engineered with properties such as chemical resistance, high tensile strength, durability against ultraviolet (UV) degradation, and puncture resistance to withstand harsh conditions, including exposure to aggressive leachate constituents and heavy overburden loads. The material is typically manufactured in large sheets, which are seamed together on-site using thermal or chemical fusion techniques to form a continuous, leak-proof lining system critical for regulatory compliance and long-term environmental protection.

The global Leachate Pool Geomembrane market size was estimated at USD 116.58 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
