Report Overview

Energy storage systems (ESS) store surplus electricity and facilitate the use of batteries when the generated electricity is greater than the demand. The surplus power saved in these systems is supplied to the customers when the demand exceeds the supply. Countries are investing heavily in grid infrastructures to overcome the power supply irregularities, and this is expected to drive the growth of the battery market. ESS comprise various technologies, such as pumped-hydro storage systems, flywheels, lead-acid batteries, and advanced batteries (Li-ion).

The lead-acid battery is the oldest type of rechargeable battery. Despite having a very low energy-to-weight ratio and a low energy-to-volume ratio, its ability to supply high surge currents means that the cells have a relatively large power-to-weight ratio. These features, along with their low cost, make them attractive for use in motor vehicles to provide the high current required by automobile starter motors.
