## Abstracts

Lead-antimony concentrate is an ore mainly containing lead and antimony elements, usually composed of lead and antimony compounds, and is obtained through ore mining, beneficiation, smelting and other processing processes. It is the raw material for lead and antimony production, and is widely used in smelters to produce lead and antimony alloys, metallurgical catalysts, etc. During the smelting process of lead-antimony concentrate, the lead and antimony contained will be extracted and then further processed into various lead or antimony products, such as lead ingots extracted from lead smelting, and antimony smelting for the production of various antimony alloys and chemicals. The quality and ore composition of lead-antimony concentrate are important determinants of demand and price. The mines and smelters to which it belongs usually need to carry out fine ore selection and refining to meet the processing requirements of this process.
