Report Overview

Lead-free piezoelectric thin films are advanced materials that generate an electric charge in response to mechanical stress, or conversely, deform under an applied electric field, without the use of lead-based compounds. These thin films, typically ranging from nanometers to micrometers in thickness, are engineered from environmentally friendly materials such as barium titanate (BaTiO₃), potassium sodium niobate (KNN), or bismuth titanate sodium (BNT) groups. Key features include their eco-friendly composition, high electromechanical coupling, flexibility for miniaturization, and compatibility with applications requiring sustainable alternatives to traditional lead-based piezoelectric materials like lead zirconate titanate (PZT). They are primarily utilized in sensors, actuators, transducers, and energy harvesting devices across industries such as consumer electronics, automotive, medical, and industrial automation. The absence of lead aligns with global environmental regulations, making these films a critical innovation in the piezoelectric sector.
