Abstracts

A lead radiation shielding blanket is a flexible and portable protective device primarily engineered to safeguard against ionizing radiation. At its core, it features lead, a dense metal renowned for its exceptional ability to absorb and block various forms of radiation, such as X-rays and gamma rays, due to its high atomic number. The lead component is typically encased within a durable outer material, like a tough fabric or a specialized polymer, which serves to protect the lead from damage, corrosion, and wear while also providing structural integrity to the blanket. These blankets come in different thicknesses and dimensions, with the thickness determining the level of radiation attenuation they can provide. They are highly adaptable, allowing them to be draped, wrapped, or positioned around objects or individuals as needed. Widely utilized in medical settings to shield patients and healthcare workers during imaging procedures, in nuclear facilities for worker protection during maintenance and operations, and in industrial applications where radiation sources are present, lead radiation shielding blankets play a crucial role in minimizing radiation exposure and ensuring safety.

The global Lead Radiation Shielding Blanket market size was estimated at USD 147.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
