Abstracts

Lead sputtering targets are specialized materials, typically in the form of discs, plates, or other shapes, composed of high-purity lead or lead alloys, which are used in physical vapor deposition (PVD) processes, particularly magnetron sputtering, to deposit thin films of lead or lead-based compounds onto substrates such as semiconductors, optical components, and electronic devices; these targets are essential for applications requiring precise, uniform, and high-quality thin films, including infrared detectors, piezoelectric devices, radiation shielding coatings, and certain types of sensors, where the properties of lead—such as its density, atomic number, and superconductivity—are critical to performance, and their production demands stringent control over purity, microstructure, and dimensional tolerances to ensure consistent deposition rates, film adhesion, and minimal defects during the sputtering process.

The global Lead Sputtering Target market size was estimated at USD 220.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
