Abstracts

Lead wool blankets are specialized shielding materials composed primarily of lead fibers that are woven or assembled into a blanket-like structure. The lead, a dense and malleable metal renowned for its exceptional ability to absorb and block various forms of radiation, such as gamma rays and X-rays, is processed into fine fibers. These fibers are then arranged in a way that forms a flexible and relatively lightweight blanket. The structure of the lead wool blanket allows it to conform to different shapes and surfaces, making it highly adaptable for use in a variety of applications where radiation shielding is required. This could include lining walls, covering equipment, or wrapping around pipes in environments like nuclear facilities, medical imaging rooms (such as X-ray and CT scan areas), and industrial settings with radioactive sources. The blanket's ability to attenuate radiation helps protect personnel and sensitive equipment from harmful radiation exposure, while its flexibility and ease of handling offer practical advantages over more rigid shielding materials.

The global Lead Wool Blankets market size was estimated at USD 103.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
