Report Overview

Lead zirconate titanate film is mainly composed of lead zirconate (PbZrO_3) and lead titanate (PbTiO_3), which can form a continuous solid solution in any proportion. Because the ionic radius of Ti^{4+} (0.061 nanometers) and the ionic radius of Zr^{4+} (0.072 nanometers) are similar, and their chemical properties are similar, they can form a stable solid solution. Lead zirconate titanate film has an ABO₃-type structure, which is a perovskite ferroelectric material with superior performance. At a certain temperature and composition ratio, the lead zirconate titanate film will have a quasi-modal phase transition boundary (MPB), with tetragonal phase and trigonal phase on both sides of this boundary. Near the MPB, due to the coexistence of the two phases, the performance of the lead zirconate titanate film will be abnormal, such as changes in dielectric constant, piezoelectric and ferroelectric properties.

The global Lead Zirconate Titanate Film market size was estimated at USD 355 million in 2023 and is projected to reach USD 709.65 million by 2032, exhibiting a CAGR of 8.00% during the forecast period.

North America Lead Zirconate Titanate Film market size was estimated at USD 105.62 million in 2023, at a CAGR of 6.86% during the forecast period of 2024 through 2032.
