Report Overview

The Leaded Disc MOV, or Leaded Disc Metal Oxide Varistor, is a type of electronic component designed to protect circuits from voltage surges and transient overvoltages. It is characterized by its ability to conduct electricity only when the voltage across it exceeds a certain threshold, known as the breakdown voltage. The product name "Leaded Disc MOV" refers to the physical form of the varistor, which is a disc-shaped component with leads for easy integration into electronic circuits. The "Leaded" part of the name indicates that the varistor has metal leads attached, facilitating its connection to other components in a circuit. The "Disc" shape suggests its circular form, which is common for varistors to maximize the surface area for voltage distribution. "MOV" stands for Metal Oxide Varistor, highlighting the material composition that gives the varistor its unique voltage-dependent resistance properties. These varistors are widely used in various applications, such as power supplies, telecommunications, and automotive electronics, to safeguard against voltage spikes and ensure the reliability and longevity of the systems they are integrated into.
