Abstracts

Leaded tantalum capacitors are polarized electrolytic capacitors that utilize a sintered tantalum anode with an oxide layer acting as the dielectric, typically featuring a manganese dioxide or polymer electrolyte and external lead wires for through-hole mounting on printed circuit boards. These components are valued for their high capacitance per volume, excellent frequency characteristics, long-term stability, and reliability in filtering, decoupling, timing, and energy storage applications across telecommunications, medical devices, automotive electronics, military, and aerospace sectors, where their performance under demanding conditions?such as high temperatures and extended operational life?justifies their use despite competition from ceramic, aluminum electrolytic, and newer solid polymer tantalum alternatives.

The global Leaded Tantalum Capacitor market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
