Abstracts

Leafing aluminium paste is a specialized metallic pigment composed of finely ground aluminium flakes suspended in a solvent or carrier medium, designed to create a highly reflective, mirror-like surface effect when applied to various substrates. Its defining characteristic is the parallel alignment of the aluminium flakes during the drying or curing process, which results in a brilliant silver or chrome-like finish with excellent opacity and light reflectivity. This product is distinct from non-leafing varieties, as it contains stearic acid or other fatty acids that cause the flakes to float to the surface of the coating, enhancing its metallic appearance and barrier properties. It is widely used in industrial and decorative applications, including automotive coatings, printing inks, plastics, and protective paints, where aesthetic appeal, corrosion resistance, and durability are critical.

The global Leafing Aluminium Paste market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
