Abstracts

Leather coloring agents can be divided into pigments and dyes. Pigments are insoluble in water or organic solvents and can only be mixed in solvents. They do not have affinity for leather and must be coated on the surface of leather with appropriate film-forming agents (or adhesives). Pigments are opaque and have good covering power, dispersing into particles in the coating agent to cover and color the coating. Most pigments are inorganic, but there are also organic compounds and dyes. Leather coloring agents can impart various colors to leather coatings. After coloring leather, various colors and varieties of products can be obtained, which can improve the beauty and grade of the products, and also make the leather easy to identify. Leather coloring agents have the following basic functions: to give leather products a specific color; Make the surface color of leather products more uniform and beautiful; Having the ability to cover up and conceal the original defects of the raw leather; Various colors can be adjusted to assist in creating a special trend effect.

The global Leather Coloring Agent market size was estimated at USD 3196.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
