Abstracts

The LEC crucible is a special crucible used in the liquid phase epitaxy (Liquid Encapsulated Czochralski, LEC) growth process. LEC growth is a method for growing semiconductor materials. By adding a liquid encapsulation material (usually molten boric acid glass) to the crucible, the material during the growth process is wrapped in the liquid, thereby achieving the growth of a single crystal material. The main feature of LEC crucibles is the ability to contain and encapsulate liquid encapsulation materials, while having good thermal conductivity and chemical stability. LEC crucibles are usually made of high melting point materials, such as graphite, quartz, etc., to ensure stable structure and performance at high temperatures. The LEC crucible plays a key role in the LEC growth process, it can hold the liquid encapsulation material and provide stable temperature control and heat conduction, so that the material can be grown under suitable temperature conditions. At the same time, the LEC crucible also needs to have good high temperature resistance and chemical stability to ensure the stability of the growth process and the quality of the material.
