## Abstracts

LECO (short for Laboratory Equipment Corporation) combustion analysis refers to a method of determining the elemental composition of organic and inorganic materials, specifically for hydrogen (H), carbon (C), nitrogen (N), oxygen (O), and sulfur (S). It involves the combustion of a sample at high temperatures, followed by the detection and quantification of the resulting combustion products. The LECO combustion analysis method typically involves placing a known mass of the sample into a combustion chamber where it's heated to high temperatures in the presence of oxygen. The organic material in the sample is converted into gaseous combustion products such as CO<sub>2</sub>, H<sub>2</sub>O, NO<sub>x</sub>, SO<sub>x</sub>, etc. The combustion products are then separated and quantified using various detection methods.

The global LECO Combustion Analysis market size was estimated at USD 743.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
